Inox wall bracket

The wall-mounted bracket is the ideal solution for fitting your cabinets and enclosures in areas where floor space is limited or needs to be kept clear. Designed around a suspended support principle, it provides a strong, fully secure wall fixing for your equipment.

This type of installation is especially recommended for industrial settings, workshops or technical rooms where making the most of space, easy floor cleaning and smooth movement of people and equipment are key priorities.

DESCRIPTION:

Made from 304L stainless-steel tubing with a 30x30 mm section, this wall bracket delivers outstanding strength and excellent corrosion resistance in most industrial settings. Its design is engineered to safely carry the weight of cabinets and enclosures over the long term.

For installations exposed to harsher conditions (coastal environments, chemical or food industries), a 316L stainless-steel version is also available on request for maximum durability.

BENEFITS:

- Space-saving: Frees up floor space completely, making cleaning easier and improving the flow of people and equipment.
- Stability and safety: Provides a secure, long-lasting wall fixing for your enclosures.
- Smart and practical: A lighter-looking option that's just as functional as a traditional floor stand.
- Durability: Stainless steel delivers a long service life, with no risk of rust-related deterioration.
